

Attendance Scenario Calculator

A simple Python-based command-line tool that helps students calculate their current attendance percentage, find out how many classes they need to attend to reach a target percentage, and predict future attendance based on upcoming classes.

Features

- Calculate current attendance percentage
- Find classes needed to reach a target attendance percentage
- Predict future attendance after upcoming attended/missed classes
- Input validation (rejects negative, invalid, or inconsistent values)
- Simple, beginner-friendly terminal interface

Formulas

- **Current Attendance %** = $(\text{Classes Attended} / \text{Total Classes}) \times 100$
- **Future Attendance %** = $((\text{Attended} + \text{Future Attended}) / (\text{Total} + \text{Future Attended} + \text{Future Missed})) \times 100$

Technologies Used

- Python 3 (standard library only, no external dependencies)

How to Run

1. Clone this repository:

```
git clone https://github.com/<your-username>/attendance-scenario-calculator.git
```

2. Move into the project folder:

```
cd attendance-scenario-calculator
```

3. Run the program:

```
python main.py
```

4. Follow the on-screen menu and enter the requested details.

Limitations

- Calculates attendance only from user-entered values.
- Does not connect to any official university attendance database.
- Results are for planning purposes only; actual institutional rules may differ.
